Used & New Car Market Analysis

Price and Supply Dashboard Report

Prepared by Awe Daniel

Data Source: Power BI Dashboard — Cars45 Nigeria Listings (1,722 Records)

May, 2026

Executive Summary

This report analyzes a two-page Power BI dashboard built on 1,722 vehicle listings from Cars45 Nigeria, examining pricing patterns and supply distribution across selling condition, manufacturer, mileage category, year of manufacture, and colour. The dashboard is split into two complementary views: a Price Analysis Dashboard, which tracks how price varies across key vehicle attributes, and a Supply Analysis Dashboard, which tracks the volume (count) of vehicles across those same attributes. Together, they reveal a market heavily dominated by used vehicles, driven primarily by affordability, reliability, and practicality, and offer insight into consumer behaviour, dealer positioning, and emerging opportunities within Nigeria's online automotive market.

The average price across the dataset is ₦15.28 million. Registered vehicles dominate supply at 65.68% of listings, followed by imported vehicles at 34.09%, while brand-new vehicles make up a negligible 0.23% of the market. Despite their small share, brand-new vehicles command a disproportionately higher price ceiling, with the highest recorded brand-new price reaching ₦34.13 million, compared to ₦25.06 million for imported and ₦10.14 million for registered vehicles.

1. Dataset Overview

The dataset comprises 1,722 individual car records. Each record is categorized by:

- Selling condition — Brand new, Imported, or Registered (locally used)
- Maker — vehicle manufacturer/brand
- Mileage category — Low Mileage, Light Used, Average Used, High Mileage, Very High Mileage
- Year of manufacture — spanning roughly 1990 to 2025
- Colour — Black, Gray, Silver, Blue, White, Red, Gold, Green, Burgundy

These attributes form the basis of both the Price and Supply dashboards, which analyze the same underlying dataset from two different angles: what things cost, and how many of them exist.

2. Price Analysis Dashboard

This dashboard focuses on price behaviour across the dataset's key dimensions.

2.1 Headline Price Metrics

Metric	Value
Total Number of Cars	1,722

Registered Price	₦10.14 million
Imported Price	₦25.06 million
Brand New Price	₦34.13 million
Average Car Price	₦15.28 million

These headline figures immediately reveal a clear price hierarchy tied to selling condition: registered (locally used) vehicles are the most affordable, imported vehicles sit in the middle tier, and brand-new vehicles command the highest prices. The gap between registered and brand-new price points (roughly ₦24 million) suggests condition is one of the single strongest price drivers in this market.

2.2 Price by Selling Condition

The bar chart comparing Brand New, Imported, and Registered vehicles confirms the pricing tiers seen in the headline metrics. Brand-new vehicles anchor the top of the price range, imported vehicles form a substantial middle band, and registered vehicles anchor the lower end. This is an expected pattern in most vehicle markets, where condition and import status carry a direct cost premium tied to freight, duty, and depreciation.

2.3 Price by Maker (Top Brands by Price)

The 'Price by Maker' chart ranks manufacturers by price contribution, led by Tesla, followed by Rover, Dongfeng, Porsche, Changan, Mercedes-Benz, Land Rover, GAC, and Genesis. Notably, this list is dominated by premium and niche brands (Tesla, Porsche, Land Rover, Genesis) alongside some brands not typically associated with premium pricing (Dongfeng, Changan, GAC), suggesting that within this dataset, either a small number of high-value listings for these makes are skewing the aggregate, or these particular models represent premium trims within otherwise mass-market brands.

This chart should be read as a price concentration ranking rather than a popularity ranking — it reflects where the money is, not where the volume is (see Section 3.3 for the volume perspective, which paints a very different picture).

2.4 Price by Mileage Category

Price declines as mileage category increases, following the intuitive used-car depreciation curve: Low Mileage vehicles command the highest prices, tapering down through Light Used and Average Used, and reaching their lowest point at High Mileage and Very High Mileage. This is consistent with standard vehicle valuation practice, where accumulated mileage is one of the primary depreciation factors.

2.5 Price by Year of Manufacture

The price-by-year trend line, plotted from 1990 through 2025, shows a general upward trajectory in price as manufacture year increases, with more recent model years (post-2015) commanding noticeably higher prices than older ones. This aligns with the mileage findings above and reinforces that vehicle age/recency is a dominant price factor across the dataset.

3. Supply Analysis Dashboard

This dashboard shifts focus from price to volume — how many vehicles fall into each category.

3.1 Headline Supply Metrics

Metric	Value
Total Number of Cars	1,722
Registered %	65.68%
Imported %	34.09%
Brand New %	0.23%
Average Price	₦15.28 million

Registered (locally used) vehicles make up nearly two-thirds of all listings, imported vehicles account for roughly a third, and brand-new vehicles are almost absent from supply at just 0.23% (around 4 vehicles out of 1,722). This is a striking contrast to Section 2.1: brand-new vehicles are the most expensive category by far, yet they represent a negligible fraction of what is actually available in the market.

3.2 Total Number by Selling Condition

The bar chart confirms the percentages above: Registered vehicles form the tallest bar (approaching 1,000+ units), Imported vehicles form a mid-sized bar, and Brand New forms a negligible bar. The market is overwhelmingly composed of used vehicles, whether locally registered or imported.

3.3 Total Number by Maker (Top Brands by Volume)

The volume ranking is led by Toyota, followed by Lexus, Mercedes-Benz, Honda, Hyundai, Ford, Nissan, Kia, and Acura. This list is almost entirely different from the price-leading brands in Section 2.3 (Tesla, Rover, Dongfeng, Porsche, etc.), which confirms that the brands generating

the highest price figures are not the brands driving actual sales volume. Toyota's dominance in volume, paired with its absence from the top price-ranked makers, suggests Toyota vehicles are priced more affordably on average but sell in far greater numbers — a classic high-volume, moderate-margin position.

3.4 Total Number by Mileage Category

Supply is heavily concentrated at the higher end of the mileage spectrum: Very High Mileage and High Mileage categories contain the largest counts of vehicles, while Average Used, Light Used, and Low Mileage categories contain progressively fewer vehicles. Combined with the price findings in Section 2.4 (where low mileage commands the highest price), this indicates the market supply is skewed toward older, higher-mileage vehicles — precisely the segment that commands the lowest prices.

3.5 Total Number by Year of Manufacture

The year-of-manufacture volume chart (1990–2025) shows the bulk of listed vehicles cluster within a mid-range band of manufacture years rather than at the very newest or very oldest end, consistent with the mileage distribution above — most vehicles in this market are moderately aged rather than brand-new or extremely old.

3.6 Total Number by Colour

Colour distribution is led by Black, followed by Gray, Silver, Blue, White, Red, Gold, Green, and Burgundy. Neutral tones (black, gray, silver, white) dominate the dataset, which mirrors well-documented global consumer preference patterns for resale-friendly, neutral vehicle colours.

4. Brand Positioning Analysis

Reading the price and volume dashboards side by side reveals distinct positioning strategies across manufacturers rather than a single price-volume trend.

- Toyota — maintains the strongest overall market presence, with over 600 listings. This scale reinforces its long-standing reputation in Nigeria for reliability and resale confidence, and reflects a high-volume, accessibility-first position.
- Tesla — sits at the premium extreme, with average listing prices approaching ₦100 million. It serves a fundamentally different, much smaller economic segment than the rest of the market.
- Mercedes-Benz and Honda — occupy a more difficult middle ground, neither dominating volume nor commanding the highest pricing power, suggesting a less clearly defined market position relative to Toyota and the premium brands.
- Lexus — demonstrates a stronger balance between premium perception and practical market alignment, capturing meaningful pricing power without losing broad accessibility.

5. Vehicle Age & Supply Dynamics

Post-2020 vehicles showed high asking prices but relatively low listing representation. This combination may indicate weaker alignment between newer inventory and broader market affordability, mirroring the brand-new scarcity noted in Section 3.1.

In contrast, the 2005-2015 vehicle segment demonstrated the highest listing concentration, suggesting that this range offers the strongest balance between reliability, accessibility, and buyer demand.

6. Consumer Preference Indicators

Black was the dominant vehicle colour across listings, followed by Gray, Silver, Blue, and White. Brighter colours such as Red, Gold, and Green appeared far less frequently.

This pattern suggests that buyers and sellers prioritize practicality, resale confidence, and conservative purchasing decisions over lifestyle expression, consistent with a market where value retention outweighs personalization.

7. Cross-Dashboard Insights

- Price and volume leadership diverge sharply: high-priced brands (Tesla, Porsche, Land Rover) are not the high-volume brands (Toyota, Lexus, Honda). Any strategy built purely on 'top price' charts would misrepresent where the actual market activity is.
- Brand-new vehicles are priced highest but supplied least — under 1% of listings. This scarcity likely amplifies their aggregate price contribution and should be treated as a small-sample signal, not a representative price benchmark.
- Mileage and price move inversely, while mileage and volume move together at the high end: most available vehicles are also the most depreciated. This confirms mileage as a central lever in both value and availability.
- The market is fundamentally a used-vehicle market (99.77% registered or imported), so pricing strategy, marketing, and inventory decisions should be built around registered and imported segments rather than the brand-new category.
- The 2005-2015 manufacture band combines the highest listing concentration with moderate pricing, positioning it as the market's practical sweet spot, while post-2020 vehicles show the opposite pattern of high price but thin supply.

8. Strategic Recommendations

For Buyers

Focus on imported 2005-2015 vehicles within the Average Use mileage category, where value and negotiating opportunities appear strongest.

For Dealers

Toyota remains highly saturated. Lexus and Mercedes-Benz may provide stronger differentiation opportunities within the mid-premium segment.

For Investors

Monitor the post-2020 segment closely, as reduced liquidity combined with economic pressure could create future repricing opportunities.

Additional Analytical Recommendations

- Treat the 'Price by Maker' ranking and 'Total Number by Maker' ranking as complementary, not interchangeable — pair them when presenting brand performance to avoid overstating the relevance of low-volume premium brands.
- Given brand-new vehicles represent only 0.23% of supply, exercise caution when using brand-new price figures (₦34.13M) as a benchmark, as they are based on a very small number of records and may not be statistically stable.
- Since neutral colours (black, gray, silver) dominate supply, any inventory or resale-value analysis should account for the fact that non-neutral colours (green, burgundy) are a distinct, lower-volume niche and may carry different price dynamics not fully visible in this dashboard.
- Consider adding a combined price-per-mileage-category-per-maker view in a future iteration, since the current dashboards analyze price and supply separately across the same dimensions but do not cross-tabulate maker against mileage directly.

9. Research Limitation

This analysis is based on listing data rather than completed sales transactions. Therefore, the findings reflect seller behaviour and supply-side positioning rather than confirmed purchasing outcomes, and prices should be read as asking prices rather than realized sale prices.

10. Conclusion

Taken together, the Price and Supply dashboards tell a coherent story about this vehicle market: it is a used-vehicle-dominated market where the vast majority of supply sits in the registered and imported categories, tilted toward higher-mileage, moderately aged vehicles. Price is driven predictably by condition, mileage, and manufacture year, while the makers commanding the highest prices are largely disconnected from the makers commanding the highest sales volume. Brand positioning further shows that scale (Toyota), premium exclusivity (Tesla), and balanced positioning (Lexus) represent three distinct, coexisting strategies within the same market. Understanding both dashboards together — rather than either in isolation — is essential to forming an accurate picture of this market's actual dynamics.
